The presentation shows a specific research on the mining of rare earth metals in the Republic of South Africa (RSA). Currently, the South Africa's mining industry is specified in the coal, gold and diamond exploitation. However, a huge development of the tech industry could make this African country one of the biggest producers of the rare earth metals all over the world. Methodology of the presentation takes into consideration the rare earth metals market with a specific focus on the South Africa's reserves of these metals and the geopolitical review of the RSA as a BRICS member. The result of the research is a short strategy of the RSA mining industry.
